

# UNUSUAL USE OF THE E.SYBOX MINI FOR SUPPLYING WATER TO THE ESPRESSO MACHINE

## WHERE:

A coffee machine is composed of: a boiler, a dispensing unit, an electric resistance, an electric pump, a spout for steam, a pressure gauge and a temperature control system.

The lack of a suitable hydraulic system for connection to a professional coffee machine, which needs a constant flow of water, led us to consider an alternative method of supplying water.

## WHEN:

2016

## THE REQUEST:

Using two tanks that provide the water supply, the E.sybox mini, a compact automatic pressure boosting system, pumps the water to the machine, ensuring the convenience of constant pressure as well as energy saving thanks to inverter technology. Thanks to its compact dimensions, it can be easily concealed in the unit. This also facilitates installation, as no additional components are required.
